

BNB  
Chain

BEQ  
Ranking

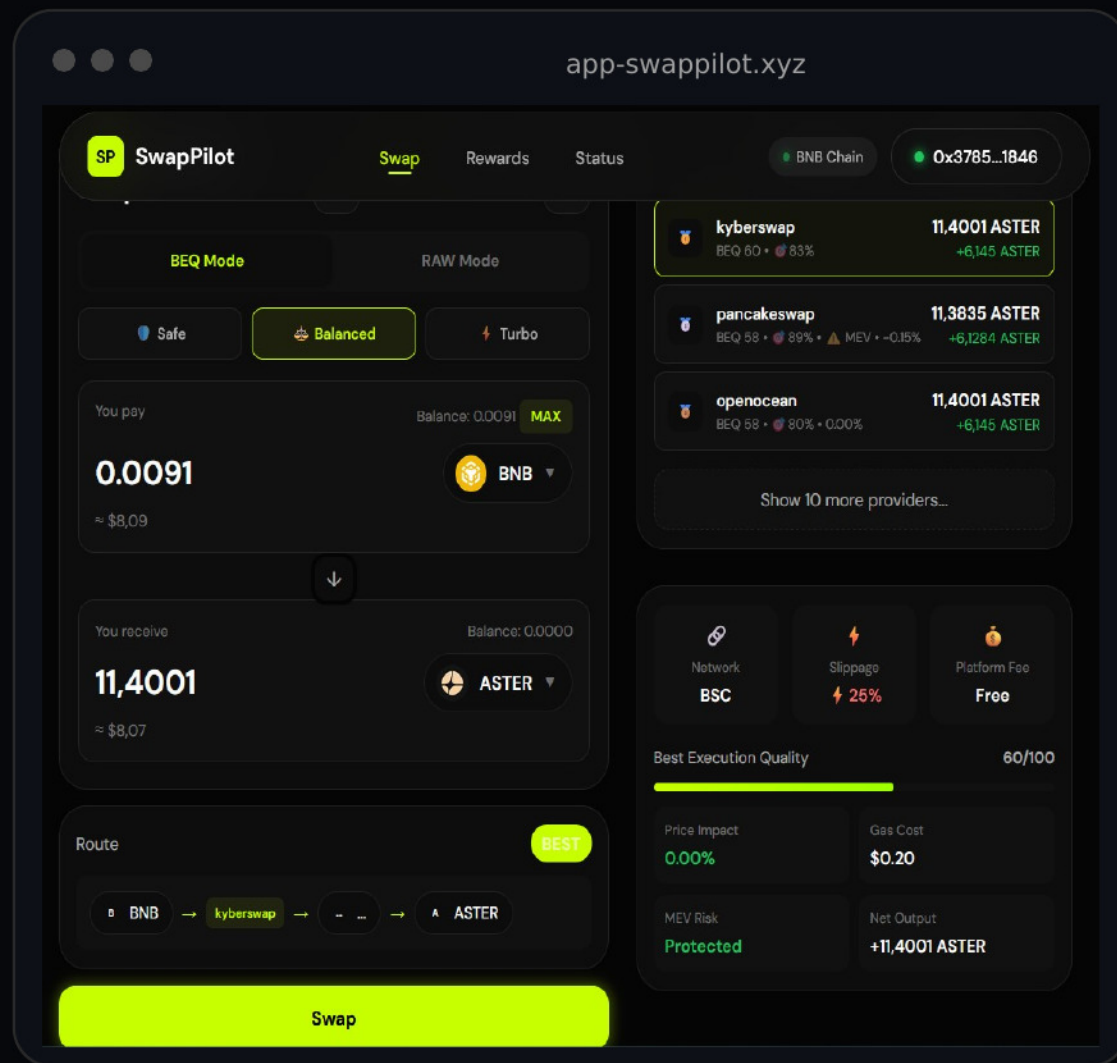

Non-  
custodial

# Safer swaps on BNB Chain.

SwapPilot is a DEX aggregator that ranks quotes into BEQ (Best Executable Quote) and optimizes for execution safety before you sign.

[Read docs →](#)

## PROBLEM

# Swaps still feel unpredictable.

Users can't reliably estimate what they will actually receive — especially on fee-on-transfer tokens and fast-moving routes.

## Fragmented liquidity

Prices differ per DEX. Manual comparison is slow and error-prone. Users waste time checking multiple platforms.

## Hidden costs

Slippage + token transfer taxes reduce net output after execution. What you see is not what you get.

## Execution risk

Routes can fail; users need preflight signals and clear warnings before signing transactions.

# One flow that optimizes & explains.

SwapPilot separates "best raw output" from "best executable" and documents every decision transparently.

## BEQ (Best Executable Quote)

Optimizes for executability first — then for output. Not just the highest number, but the safest path.

## Decision transparency

Every quote returns detailed reasoning: whyWinner · warnings · ranking rationale · assumptions.

## Risk modes

SAFE / NORMAL / DEGEN switch the BEQ weights — reasoning stays fully transparent.

PRODUCT

# How a swap happens

Four steps — mapped to real API endpoints.

## 1. Quote

POST /v1/quotes  
Fan-out to multiple providers in parallel on BSC (chainId 56).

## 2. Rank

Return rankedQuotes (BEQ) + bestRawQuotes + recommended provider.

## 3. Explain

GET /v1/receipts/:id  
whyWinner + warnings + assumptions in one artifact.

## 4. Execute

Use /v1/build-tx for ready-to-sign tx or open provider via deepLink.

COVERAGE

# Providers on BNB Chain

Top aggregators and DEX routers. BEQ prioritizes executability over the best-looking number.

## 10+ Providers

PancakeSwap · 1inch ·  
OKX DEX · KyberSwap ·  
ParaSwap · Odos ·  
OpenOcean · 0x ·  
Uniswap V2 · Uniswap V3

## Capabilities

Quotes + ranking ·  
buildTx where supported ·  
deep-links as fallback ·  
health endpoint  
`/v1/providers/status`

## Risk signals

Sellability · revert risk ·  
MEV exposure · churn ·  
optional token security  
(GoPlus / HoneyPot.is)

## Non-custodial

Users sign in their wallet.  
SwapPilot does not hold  
keys or funds. Your keys,  
your crypto.

## PROOF

# A working system.

Public app + public API. Every quote run returns detailed decision data for full auditability.

### Decision data includes

rankedQuotes · beqRecommendedProviderId · whyWinner  
· warnings · ranking.mode · preflight signals

## BUSINESS MODEL

# Revenue aligned with usage.

Simple monetization primitives already built into the stack. No projections — just shipped code.

## 💰 Fee engine (API)

Endpoints `/v1/fees/calculate` and `/v1/pilot/tier` compute fees and holding-based discounts dynamically.

## 🔥 Fee distribution (Contracts)

FeeCollector contract: 15% buy & burn · 85% treasury distribution. Deployed on BSC.

## 👛 Referral incentives (Contracts)

ReferralPool + ReferralRewards contracts support referral-based reward flows for growth.

DISTRIBUTION

# Token allocation

Fixed supply · No inflation · No mint function

	Public Sale	35%
	Treasury	20%
	CEX & Marketing	12%
	Liquidity	12%
	Team	11%
	Advisors	5%
	Referral	5%

TOKENOMICS
